This program of work is led by Dr Renate Zilkens who was successful in obtaining a research Fellowship funded through the Alzheimer’s Australia Association in combination with Curtin University and the NHMRC. So far, the main findings have been that the use of record linkage nearly double the case ascertainment of people with Alzheimer’s disease; that 39% of all WA male deaths and 50% of all WA female deaths had a lifetime history of dementia; that 67% of people with a record of dementia were hospitalised in the last year of life; 16.4% of the total bed-days in the last year of life were due to “problems accessing alternative medical facilities” or “problems related to care provider dependency; and 62% of all admissions to hospital for people with dementia were emergency admissions.

Lead: Dr Renate Zilkens
Team: Professor James Semmens
Collaborators: Professor David Bruce, University Department of Medicine, Fremantle Hospital
Professor Lorna Rosenwax, School of Occupational Therapy, Curtin University
Professor Beverley McNamara, School of Occupational Therapy, Curtin University
